- 30 This specification is related to:
 - OpenC2 Language Specification
 - Stateless Packet Filtering Application Profile

Abstract:

- Open Command and Control (OpenC2) is a concise and extensible language to enable the
- command and control of cyber defense components, subsystems and/or systems in a manner
- that is agnostic of the underlying products, technologies, transport mechanisms or other
- aspects of the implementation. HTTP over TLS is a widely deployed transfer protocol that
- provides an authenticated, ordered, lossless delivery of uniquely-identified messages. This
- specification describes the use of HTTP over TLS as a transfer mechanism for OpenC2 messages.

40 **Status:**

- This document was last revised or approved by the OASIS Open Command and Control
- (OpenC2) TC on the above date. The level of approval is also listed above. Check the "Latest
- version" location noted above for possible later revisions of this document. Any other
- numbered Versions and other technical work produced by the Technical Committee (TC) are
- listed at https://www.oasis-open.org/committees/tc home.php?wg abbrev=openc2#technical.
- TC members should send comments on this specification to the TC's email list. Others should
- send comments to the TC's public comment list, after subscribing to it by following the
- instructions at the "Send A Comment" button on the TC's web page at https://www.oasis-
- 49 open.org/committees/openc2/.
- 50 This specification is provided under the <u>Non-Assertion</u> Mode of the <u>OASIS IPR Policy</u>, the mode
- chosen when the Technical Committee was established. For information on whether any
- 52 patents have been disclosed that may be essential to implementing this specification, and any
- offers of patent licensing terms, please refer to the Intellectual Property Rights section of the
- TC's web page (https://www.oasis-open.org/committees/openc2/ipr.php).
- Note that any machine-readable content (<u>Computer Language Definitions</u>) declared Normative
- for this Work Product is provided in separate plain text files. In the event of a discrepancy
- 57 between any such plain text file and display content in the Work Product's prose narrative
- document(s), the content in the separate plain text file prevails.

1 Introduction

154

163

169

171

176

- OpenC2 is a suite of specifications to achieve command and control of cyber defense functions.
- 156 These specifications include the OpenC2 Language Specification, Actuator Profiles, and Transfer
- 157 Specifications. This transfer specification defines the procedures and conventions used when
- employing Hypertext Transfer Protocol (HTTP) and Transport Layer Security (TLS) for the transfer
- of OpenC2 command and response messages between OpenC2 Producers and Consumers. This
- specification is one of an expected portfolio of transfer specifications; implementers of OpenC2
- should select one or more transfer specifications, consistent with the characteristics and
- requirements of their cyber ecosystem.

1.1 IPR Policy

- This specification is provided under the <u>Non-Assertion</u> Mode of the <u>OASIS IPR Policy</u>, the mode
- chosen when the Technical Committee was established. For information on whether any
- patents have been disclosed that may be essential to implementing this specification, and any
- offers of patent licensing terms, please refer to the Intellectual Property Rights section of the
- TC's web page (https://www.oasis-open.org/committees/openc2/ipr.php).

1.2 Terminology

170 A list of acronyms is provided in Annex A.

1.2.1 Requirement Keywords

- The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD",
- "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be
- interpreted as described in [RFC2119] and [RFC8174] when, and only when, they appear in all
- capitals, as shown here.

1.3 Normative References

1.6 Overview

- OpenC2 is a set of specifications to achieve command and control of cyber defense functions.
 These specifications include the OpenC2 Language Specification, Actuator Profiles, and Transfer
 Specifications. The OpenC2 Language Specification and Actuator Profile(s) specifications focus
 on the standard at the origin and destination of the command while the transfer specifications
 focus on the protocols for the commands and responses in transit.
 - The OpenC2 Language Specification [OpenC2-Lang-v1.0] provides the semantics for the essential elements of the language, the structure for commands and responses, and the schema that defines the proper syntax for the language elements that represents the command or response.
 - OpenC2 Actuator Profiles specify the subset of the OpenC2 language relevant in the
 context of specific actuator functions. Cyber defense components, devices, systems
 and/or instances may (in fact are likely) to implement multiple actuator profiles, such as
 Stateless Packet Filtering. Actuator profiles extend the language by defining specifiers
 that identify the actuator to the required level of precision and may define command
 arguments that are relevant and/or unique to those actuator functions.
 - OpenC2 Transfer Specifications utilize existing protocols and standards to implement OpenC2 in specific environments. These standards are used for communications and security functions beyond the scope of the language, such as message transfer encoding, authentication, and end-to-end transport of OpenC2 messages.
 - [OpenC2-Lang-v1.0] defines a language used to compose messages for command and control of cyber defense systems and components. A message consists of a header (defined in this specification) and a payload (*defined* as a message body in the OpenC2 Language Specification Version 1.0 and *specified* in one or more actuator profiles). The language defines two payload structures:
 - 1. **Command**: An instruction from one system known as the OpenC2 "Producer", to one or more systems, the OpenC2 "Consumer(s)", to act on the content of the command.
 - Response: Any information captured or necessary to send back to the OpenC2 Producer that issued the Command i.e., the OpenC2 Consumer's response to the OpenC2 Producer.
 - In general, there are two types of participants involved in the exchange of OpenC2 messages:
 - 1. **OpenC2 Producers**: An OpenC2 Producer is an entity that creates commands to provide instruction to one or more systems to act in accordance with the content of the

293

294

295

296

297

298

- command. An OpenC2 Producer may receive and process responses in conjunction with a command.
- 2. OpenC2 Consumers: An OpenC2 Consumer is an entity that receives and acts on an OpenC2 command. An OpenC2 Consumer may create responses that provide any information captured or necessary to send back to the OpenC2 Producer.

OpenC2 implementations integrate the related OpenC2 specifications described above with related industry specifications, protocols, and standards. Figure 1 depicts the relationships among OpenC2 specifications, and their relationships to other industry standards and environment-specific implementations of OpenC2. Note that the layering of implementation aspects in the diagram is notional, and not intended to preclude, e.g., the use of an applicationlayer message signature function to provide message source authentication and integrity.

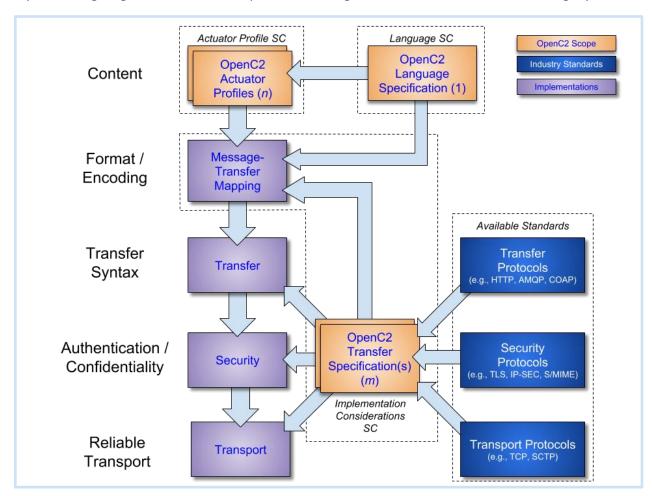

Figure 1 -- OpenC2 Documentation and Layering Model

This document specifies the use of Hypertext Transfer Protocol (HTTP) over Transport Layer Security (TLS) as a transport mechanism for OpenC2 messages; this HTTP/TLS layering is typically referred to as HTTPS [RFC2818]. As described in [RFC3205], HTTP has become a common "substrate" for information transfer for other application-level protocols. The broad availability of HTTP makes it a useful option for OpenC2 message transport in support of prototyping, interoperability testing, and for operational use in environments where appropriate security protections can be provided. Similarly, TLS is a mature and widely-used protocol for securing information transfers in TCP/IP network environments. This specification provides guidance to the OpenC2 implementation community when utilizing HTTPS for OpenC2 message transport. It includes guidance for selection of TLS versions and options suitable for use with OpenC2.

1.7 Suitability

306

308

309

310

311

312

313

314

- This OpenC2 over HTTPS transfer specification is suitable for operational environments where:
 - Connectivity between OpenC2 producers and OpenC2 consumers is:
 - Highly available, with infrequent network outages
 - Of sufficient bandwidth that no appreciable message delays or dropped packets are experienced
 - In-band negotiation of a connection initiated by either producer or consumer is possible without requiring an out-of-band signalling network.
 - The overhead of HTTPS is acceptable (e.g., multiple OpenC2 command / response exchanges can be passed through a single HTTPS connection).
- An additional application for this transfer specification is interoperability test environments.

2 Operating models

317

320

336

337

343

This section describes the operating models associated with the available assignments of endpoint roles with regard to OpenC2 and HTTP.

2.1 Endpoint Definitions

- Each endpoint of an OpenC2-over-HTTPS interaction has both an OpenC2 role and an HTTP
- function. Ideally OpenC2 Consumers will be HTTP listeners so that they can accept connections
- and receive unsolicited commands from OpenC2 Producers. With this approach OpenC2
- Producers act as 'HTTP clients' and transmit commands to Consumers.
- In some environments, networking considerations may limit or preclude this configuration. For
- example, if the OpenC2 Consumer is located behind a router that performs network port
- and/or address translation, it may not be practicable for the Producer to contact an HTTP
- server listening on behalf of the Consumer. In these cases, each OpenC2 endpoint must act as
- both an HTTP client and a server.
- One example of using HTTP as a substrate, [RFC6546], Transport of Real-time Inter-network
- Defense (RID) Messages over HTTP/TLS, addresses this situation by specifying an arrangement
- where each RID server is both an HTTP/TLS server and an HTTP/TLS client. Given the anticipated
- range of implementation environments for OpenC2, a more flexible approach appears justified,
- so this specification allows for three implementation configurations:
- The OpenC2 Consumer is the HTTP server
 - The OpenC2 Producer is the HTTP server
 - Both OpenC2 Producer and Consumer are HTTP servers
- Where possible, the configuration where the OpenC2 Consumer is the HTTP server is preferred,
- as it aligns OpenC2 command / response messaging with HTTP's request / response structure.
- The following sections briefly summarize each of these operating models. Specifications for
- how the models are implemented are provided in Section 3 and example interactions are
- 342 described in Annex B.

2.2 OpenC2 Consumer as the HTTP server

- Figure 2 illustrates the configuration where the OpenC2 Consumer operates an HTTP server. In
- this configuration, a Producer that needs to send OpenC2 commands initiates a TCP connection
- to the Consumer. Once the TCP connection is created, a TLS session is initiated to authenticate
- the endpoints and provide connection confidentiality. The Producer can then issue OpenC2
- commands by sending HTTP requests using the POST method, with Consumer OpenC2
- responses returned in the HTTP response.

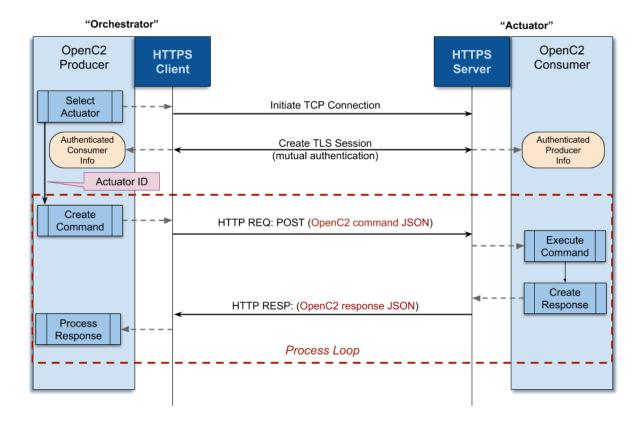

Figure 2 -- OpenC2 Consumer as HTTP Server

351

352

353

354

355

356

357

358

2.3 OpenC2 Producer as HTTP server

Figure 3 illustrates the configuration where the OpenC2 Producer operates an HTTP server. In this configuration, a Consumer that has been configured to request and accept OpenC2 commands from a particular Producer initiates a TCP connection to the Producer. Once the TCP connection is created, a TLS session is initiated to authenticate the endpoints and provide connection confidentiality. In this configuration, the exchange of OpenC2 commands and responses is driven by the Consumer using simple HTTP polling with the Producer.

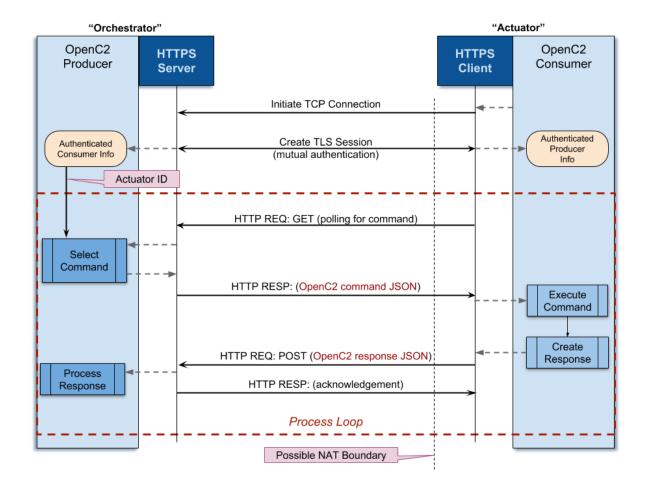

Figure 3 -- OpenC2 Producer as HTTP Server

2.4 Producer and Consumer as HTTP/TLS Servers

The configuration where both Producer and Consumer operate an HTTP server is operationally similar to the configuration where only the Consumer operates an HTTP server. In this configuration, a Producer that needs to send OpenC2 commands initiates a TCP connection to the Consumer. Once the TCP connection is created, a TLS session is initiated to authenticate the endpoints and provide connection confidentiality. The Producer can then issue OpenC2 commands by sending HTTP requests using the POST method, with Consumer OpenC2 responses returned in the HTTP response.

When the Consumer needs to send the Producer an OpenC2 response with updated status, it initiates a TCP connection to the Producer. Once the TCP connection is created, a TLS session is initiated to authenticate the endpoints and provide connection confidentiality. The Consumer can then transmit OpenC2 response messages using the HTTP POST method.

359

360

361

362

363

364

365

366

367

368

369

370

371

3 Protocol mappings

- The section defines the requirements for using HTTP and TLS with OpenC2, including general
- requirements and protocol mappings for the three operating configurations described in
- 376 Section 2.

373

377

378

3.1 Layering Overview

When using HTTPS for OpenC2 message transfer, the layering model is:

Layer	Description
OpenC2 Content	The OpenC2 Language Specification defines the overall OpenC2 language, and the Actuator Profile(s) implemented by any particular endpoint scopes the OpenC2 actions, targets, arguments, and specifiers that apply when commanding that type of Actuator.
Serialization	Serialization converts internal representations of OpenC2 content into a form that can be transmitted and received. The OpenC2 default serialization is JSON.
Message	The message layer provides a content- and transport-independent mechanism for conveying requests, responses and notifications. A message consists of content plus a set of meta items such as content type and version, sender, timestamp, and correlation id. This layer maps the transport-independent definition of each message element to its transport-specific on-the-wire representation. Note that notification messages are defined here for completeness even though OpenC2 does not currently define any notification content.
НТТР	The HTTP layer is responsible for conveying request, response, and notification messages, as described in this specification.
TLS	The TLS layer is responsible for authentication of connection endpoints and confidentiality and integrity of transferred messages.
Lower Layer Transport	The lower protocol layers are responsible for end-to-end delivery of messages. TCP/IP is the most common suite of lower layer protocols used with HTTPS.

3.2 General Requirements

380

383

389

390

391

393

394

- This section defines serialization, HTTP, and TLS requirements that apply regardless of operating model.
 - 3.2.1 Serialization and Content Types
- While the OpenC2 language is agnostic of serialization, when transferring OpenC2 messages
- over HTTP/TLS as described in this specification, the default JSON verbose serialization
- described in [OpenC2-Lang-v1.0] MUST be used.
- As described in [OpenC2-Lang-v1.0], transfer protocols must convey message elements. Two content types are defined here to support that requirement:
 - OpenC2 Command:
 - o msg type: "request"
 - Content type: application/openc2-cmd+json;version=1.0
- OpenC2 Response:
 - Msg type: "response"
 - Content type: application/openc2-rsp+json;version=1.0
- OpenC2 command messages sent over HTTPS MUST use the content type "application/openc2-cmd+json;version=1.0".
- OpenC2 response messages sent over HTTPS MUST use the content type "application/openc2-rsp+json;version=1.0".
 - 3.2.2 HTTP Usage
- 400 OpenC2 Consumers MUST be HTTP listeners, to implement the operating model described in
- Section 2.2. OpenC2 Producers SHOULD be HTTP listeners, to support the operating models
- described in Sections 2.3 and 2.4. OpenC2 Producers and Consumers acting as HTTP listeners
- SHOULD listen on port 443, the registered port for HTTPS.
- 404 OpenC2 endpoints MUST implement all HTTP functionality required by this specification in
- accordance with HTTP/1.1 ([RFC7230], et. al.). As described in the following table, the only
- 406 HTTP request methods utilized are GET and POST.

HTTP Method	Utilized
GET	Yes
HEAD	No
POST	Yes

PUT	No
DELETE	No
CONNECT	No
OPTIONS	No
TRACE	No

408

409

410

411

412 413

416

- Each HTTP message body MUST contain only a single OpenC2 command or response message. This does not preclude a Producer and Consumer exchanging multiple OpenC2 command and response messages over time during a single HTTPS session. Depending on the set-up, a server and client can have multiple connections, but a sequence of OpenC2 interactions can spread over multiple connections. In some cases the connection may drop, but the session remains open (in an idle state).
- All HTTP request and response messages containing OpenC2 payloads SHOULD include the "Cache-control:" header with a value of "no-cache".

3.2.3 TLS Usage

- HTTPS, the transmission of HTTP over TLS, is specified in Section 2 of [RFC2818]. OpenC2
- endpoints MUST accept TLS version 1.2 [RFC5246] connections or higher for confidentiality,
- 419 identification, and authentication when sending OpenC2 messages over HTTPS, and SHOULD
- accept TLS Version 1.3 [RFC8446] or higher connections.
- 421 OpenC2 endpoints MUST NOT support any version of TLS prior to v1.2 and MUST NOT support
- any version of Secure Sockets Layer (SSL).
- The implementation and use of TLS SHOULD align with the best currently available security
- guidance, such as that provided in [RFC7525]/BCP 195.
- The TLS session MUST use non-NULL ciphersuites for authentication, integrity, and
- confidentiality. Sessions MAY be renegotiated within these constraints.
- OpenC2 endpoints supporting TLS v1.2 MUST NOT use any of the blacklisted ciphersuites
- identified in Appendix A of [RFC7540].
- OpenC2 endpoints supporting TLS 1.3 MUST NOT implement zero round trip time resumption
- 430 (O-RTT).
- When deployed in an operational environment, OpenC2 endpoints MUST support basic
- 432 authentication and SHOULD support mutual authentication. When mutual authentication is

- used, endpoints SHOULD support full path validation on each certificate, as defined in
- 434 [RFC5280].

3.3 OpenC2 Consumer as HTTP/TLS Server

- 436 This section defines HTTP requirements that apply when the OpenC2 consumer is the HTTP
- 437 server.
- When the OpenC2 Consumer is the HTTP server, the Producer is able to initiate a connection to
- a specific Consumer and directly transmit OpenC2 messages containing commands; the HTTP
- POST method is used, with the OpenC2 command body contained in the POST body.
- The contents of the X-Correlation-ID HTTP header MUST match the command-id in the OpenC2
- message that is in the payload body, if one is present in the payload.
- The following HTTP request headers MUST be populated when transferring OpenC2 commands:
- Host: host name of HTTP server: listening port number (if other than port 443)
- Content-type: application/openc2-cmd+json;version=1.0
- Date: date-time in HTTP-date format as defined by RFC 7231
- X-Correlation-ID: contains the OpenC2 command-id
- The following HTTP response headers MUST be populated when transferring OpenC2
- 449 responses:

451

454

463

464

- Date: date-time in HTTP-date format as defined by RFC 7231
 - Content-type: application/openc2-rsp+json; version=1.0
- 452
 X-Correlation-ID: contains the OpenC2 command-id
- Example messages can be found in Annex B, section B.1.

3.4 OpenC2 Producer as HTTP/TLS Server

- 455 This section defines HTTP requirements that apply when the OpenC2 Producer is the HTTP
- 456 server.
- When the OpenC2 Producer is the HTTP server, the Consumer must poll for commands. The
- 458 Consumer checks for commands by polling the Producer with the HTTP GET method. The
- polling interval is a matter of Consumer configuration. The interval SHOULD be short enough to
- meet latency requirements, but long enough to avoid excessive load on the server...
- 461 Since OpenC2 responses may not always be available immediately, the Producer may be in any
- of four states with respect to a particular Consumer when that Consumer polls:
 - Producer has both commands and status queries
 - Producer has commands but no status queries

 Producer has status queries but no command 	•)	Producer	has	status	queries	but	no	comma	and	ls
--	---	---	----------	-----	--------	---------	-----	----	-------	-----	----

- Producer has neither commands nor status queries
- The intent is that the Producer is able to transmit all commands and status queries to the
- 468 Consumer and receive corresponding responses in a contiguous sequence of exchanges. To
- accomplish this, the Consumer MUST poll the Producer using the HTTP GET method to inquire
- whether the Producer has traffic for the Consumer. Polling messages sent by a Consumer MUST
- NOT contain an OpenC2 command-id and MUST NOT populate the HTTP X-Correlation-ID
- header field. Polling messages sent by a Consumer SHOULD populate the Accept: header with
- 473 'application/openc2-cmd+json; version=1.0'. The Producer will respond to each GET request
- with an HTTP response with code 200, OK, and a single command or status query in the
- response body, until the Producer's set of commands and queries is exhausted. The order in
- which the Producer sends multiple commands and/or status queries is undefined. After each
- exchange, the Consumer polls again without delay, until it receives an HTTP response with code
- 478 204, No Content.

466

484

492

493

497

- The following HTTP request headers MUST be populated when a Producer responds to a
- 480 Consumer's polling request with an OpenC2 command:
- Host: host name of HTTP server: listening port number (if other than port 443)
- Content-type: application/openc2-cmd+json; version=1.0
- Date: date-time in HTTP-date format as defined by RFC 7231
 - X-Correlation-ID: contains the OpenC2 command-id
- When the Producer sends a command in response to a Consumer poll, the Producer MUST
- populate the HTTP X-Correlation-ID field with the command-id value the Producer has assigned
- to the command. When the Producer sends a status query in response to a Consumer poll, the
- command-id in the X-Correlation-ID field MUST contain the command-id the Producer assigned
- when the command was originally sent.
- The following HTTP response headers MUST be populated by a Consumer when transmitting
- 491 OpenC2 responses:
 - Date: date-time in HTTP-date format as defined by RFC 7231
 - Content-type: application/openc2-rsp+json;version=1.0
- X-Correlation-ID: contains the OpenC2 command-id of the command to which this response applies
- Example messages can be found in Annex B, section B.2.

3.5 OpenC2 Producer and OpenC2 Consumer as HTTP/TLS Servers

- When both the Producer and the Consumer act as HTTP servers, the Producer contacts the
- Consumer to send commands and status queries as described in Section 3.3. If the Consumer
- needs to send an OpenC2 response to the Producer asynchronously, it uses the process

- described in Section 3.4, initiating the connection and using the HTTP POST method to send the
- 502 OpenC2 response message.
- 503 Example messages for Producers sending OpenC2 commands can be found in Annex B, section
- B.1. Example messages for Consumers asynchronously posting response messages can be found
- in Annex B, section B.2.

4 Conformance

506

512

514

515

516

517

526

527 528

This specification defines a set of basic conformance requirements that all implementations must meet to claim conformance. An additional set of conformance requirements are defined for fully-authenticated implementations. Users of this specification deploying OpenC2 in an operational environment are strongly recommended to use fully-authenticated implementations in order to provide adequate security.

4.1 Basic Conformance

- A conformant implementation of this transfer specification MUST:
 - 1. Support JSON serialization as specified in Section 3.2.1
 - 2. Transfer OpenC2 messages using the content types defined in Section 3.2.1 appropriately, as specified in Sections 3.3 and 3.4
 - 3. Listen for HTTPS connections as specified in Section 3.2.2.
 - 4. Use HTTP GET and POST methods as specified in Sections 3.2.2, 3.3, and 3.4, and no other HTTP methods
 - 5. Ensure HTTP request and response messages only contain a single OpenC2 message, as specified in Section 3.2.2
 - 6. Implement TLS in accordance with the requirements and restrictions specified in Sections 3.2.3 and 3.2.3.1
 - 7. Employ HTTP methods to send and receive OpenC2 messages as specified in Sections 3.3 and 3.4
 - 8. Employ only the HTTP response codes as specified in Sections 3.3 and 3.4
 - 9. Instantiate the message elements defined in Table 3.2 of [OpenC2-Lang-v1.0] as follows:

Name	HTTPS Implementation
content	JSON verbose serialization of OpenC2 commands and responses carried in the HTTP message body
content_type / msg_type	Combined and carried in the HTTP Content-type and Accepted headers: Command: application/openc2-cmd+json;version=1.0 Response: application/openc2-rsp+json;version=1.0
status	Numeric status code supplied by OpenC2 Consumers is carried in the HTTP Response start line status code.
request_id	Valued supplied by OpenC2 Producers is carried in HTTP X- Correlation-ID header and delivered to recipient along with

	OpenC2 command.			
created	Carried in the HTTP Date header			
from	Populated with the authenticated identity of the peer entity, consistent with the configured authentication scheme.			
to	Carried in the HTTP Host header			

Table 4.1 - Message Element Implementation

530

531

529

4.2 Fully-Authentication Conformance

532533534

10. Fully-authenticated implementations of this transfer specification MUST support mutual authentication using public key certificates with full path validation, as specified in Section 3.2.3.

Annex A. Acronyms

Term	Expansion			
0-RTT	Zero Round Trip Time			
API	Application Programming Interface			
HTTP	Hypertext Transfer Protocol			
HTTPS	HTTP over TLS			
IETF	nternet Engineering Task Force			
IPR	ntellectual Property Rights			
JSON	JavaScript Object Notation			
RFC	Request For Comment			
RID	Real-time Inter-network Defense			
TC	Technical Committee			
ТСР	Transmission Control Protocol			
TLS	Transport Layer Security			

Annex B. Examples

- OpenC2 commands and responses need to be transmitted with certain relevant head
- information (i.e., metadata), as described in Section 3.2 of [OpenC2-Lang-v1.0]. When sending
- OpenC2 commands and responses over HTTP/TLS, the OpenC2 message elements are handled
- as described in Table 4.2.

538

547

562

A Request-URI ending in /openc2 is used in all example HTTP requests.

B.1 HTTP Request / Response Examples: Consumer as HTTP Server

- This section presents the HTTP message structures used when the OpenC2 Consumer acts as
- the HTTP listener.

B.1.1 Producer HTTP POST with OpenC2 Command

548 Example message:

```
. . .
549
     POST /openc2 HTTP/1.1
550
     Host: oc2consumer.company.net
551
     Content-type: application/openc2-cmd+json; version=1.0
552
     Date: Day, DD Mon YYYY HH:MM:SS GMT
553
     X-Correlation-ID: shq5x2dmgayf
554
555
556
            "action": ...
557
            "target": ...
558
            "args": ...
559
560
561
```

B.1.2 Consumer HTTP Response with OpenC2 Response

563 Example message:

```
564
     HTTP/1.1 200 OK
565
     Date: Day, DD Mon YYYY HH:MM:SS GMT
566
     Content-type: application/openc2-rsp+json; version=1.0
567
     X-Correlation-ID: shq5x2dmgayf
568
569
570
            "id ref": ...
571
            "status": 200
572
            "status text": ...
573
            "results": { ...
574
575
```

609

610

611

612

613

577 B.2 HTTP Request / Response Examples: Producer as HTTP Server

- 578 This section presents the HTTP message structures used when the OpenC2 Producer acts as the
- 579 HTTP listener.

580 B.2.1 Consumer Polls Producer with HTTP GET

- Consumers use the HTTP GET method to poll a Producer for available commands and status
- queries. No message body is required.

```
GET /openc2 HTTP/1.1
Host: oc2producer.company.net
Accept: application/openc2-cmd+json;version=1.0
Cache-control: no-cache
Date: Day, DD Mon YYYY HH:MM:SS GMT

Market Mar
```

B.2.2 Producer HTTP Response with OpenC2 Command

If the Producer has commands for the Consumer, the Producer returns HTTP 200, Success and places an OpenC2 message with a command body in the body of the HTTP response. This signals the Consumer to process the command, send an HTTP POST with its OpenC2 response message, and then poll again for additional messages from the Producer.

```
. . .
596
     HTTP/1.1 200 OK
597
     Date: Day, DD Mon YYYY HH:MM:SS GMT
598
     Content-type: application/openc2-cmd+json; version=1.0
599
      X-Correlation-ID: bf5t2ttrsc8r
600
601
602
            "action": ...
603
            "target": ...
604
            "actuator": ...
605
            "args": ...
606
607
608
```

B.2.3 Producer HTTP Response with OpenC2 Status Query

If the Producer has status queries for the Consumer, the Producer returns HTTP 200, Success and places an OpenC2 message with a command to query status in the body of the HTTP response. The id in the OpenC2 message header identifies the command for which updated status is requested. This signals the Consumer to process the status query, send an HTTP POST

with its OpenC2 response message, and then poll again for additional messages from the Producer.

```
. . .
616
     HTTP/1.1 200 OK
617
     Date: Day, DD Mon YYYY HH:MM:SS GMT
618
     Content-type: application/openc2-cmd+json;version=1.0
619
     X-Correlation-ID: bf5t2ttrsc8r
620
621
      {
622
            "action": "query"
623
            "target": "command"
624
625
626
```

B.2.4 Producer HTTP Response with No Content

If the Producer has no commands or status queries for the Consumer, the Producer returns HTTP 204, No Content. This signals the Consumer to return to its default polling interval.

635

B.2.5 Consumer HTTP POST with OpenC2 Response

636 Consumers use the HTTP POST method to send OpenC2 response messages to the Producer.

```
• • •
637
     POST /openc2 HTTP/1.1
638
     Host: oc2producer.company.net
639
     Content-type: application/openc2-rsp+json; version=1.0
640
     Date: Day, DD Mon YYYY HH:MM:SS GMT
641
     X-Correlation-ID: bf5t2ttrsc8r
642
643
644
            "id ref": ...
645
            "status": 200
646
            "status text": ...
647
            "results": { ...
648
            }
649
650
651
```

Revision	Date	Editor	Changes Made
v1.0-wd01-wip	6/15/2018	Lemire	Initial working draft
v1.0-wd01-wip	6/29/2018	Lemire	Added Suitability section (1.6), responded to SC member comments
v1.0-wd01-wip	7/20/2018	Lemire	Additional responses to member comments; formatting clean-up for easier conversion to Markdown.
v1.0-wd01-wip	8/9/2018	Lemire	Implementing feedback from the July 2018 face-to-face meeting and resolving other comments to reach WD01 version to submit for CSD ballot.
v1.0-wd02-wip	8/24/2018	Lemire	Various edits to clarify interactions when the producer is HTTP listener; other edits and cleanup in response to document comments and Slack forum discussions.
v1.0-wd02-wip	8/29/2018	Lemire	 Adjustments to content type definitions to distinguish commands and responses; Made corresponding adjustments to message flow descriptions and sample messages. Added acknowledgements.
v1.0-wd02-wip	8/30/2018	Lemire	Inserted proposed replacements for sequence diagrams (Figures 2 and 3).
v1.0-wd02-wip	8/31/2018	Lemire	 Inserted initial draft conformance language (section 4). Revised Section 1 content for greater consistency with related OpenC2 specifications. Revised section 2.1 to merge proposed endpoint role descriptions General edit for formatting, readability, consistency, etc.
v1.0-wd02-wip	9/11/2018	Lemire	 Reviewed and accepted / rejected comments. Added placeholders for addressing use of "From" field. Added statements about using Cache-

			control
v1.0-wd02-wip	9/17/2018	Lemire	 Added table to conformance section specifying mapping of Language Spec message elements. Clarified certificate mutual authentication requirement. Removed language about unsolicited responses from Consumers Numbered the conformance items
v1.0-wd02-wip	9/17/2018	Lemire	1) Removed used of the HTTP "From:" field, and mapped the OpenC2 "from" message element to the authenticated identity of the peer entity 2) Updated examples to remove HTTP From:
v1.0-wd02-wip	9/19/2018	Lemire	 Final clean-up of residual comments and edits to create WD02 package for CSD ballot. Renamed document to WD03-wip
v1.0-wd03-wip	10/15/2018	Lemire	 Reorganized section 1 to align with other OpenC2 specifications Reworded section 3.2.1 to properly use MUST / SHALL language Clarified requirements wording section to better indicate TLS version requirements and preferences, and authentication requirements. Updated Table 4-1 to align with changes to Language Specification Table 3-1.
v1.0-wd03-wip	10/16/2018	Lemire	1) Final clean-up of residual edits to create WD03 package for CSD approval and release for public review.
